

Current Challenges in Health Care Enterprises

Jamie Ferguson
Fellow, Institute for Health Policy
Vice President, Health IT Strategy & Policy

Presentation Agenda

- Background
 - About Kaiser Permanente
 - About Clinical Terminology, Its Challenges, and How It Is Used
- Challenges Using, Managing, And Analyzing Health Care Data

About Kaiser Permanente

Kaiser Permanente

An Integrated Delivery System

Largest integrated delivery system in US
(bigger than 42 states & 130 countries)

- primary care
- specialty care
- home care
- hospital
- lab
- pharmacy
- imaging
- optical
- dental
- insurance
- research

Kaiser Permanente By The Numbers (2015)

433,413 hospital admissions;
6,291 neurosurgeries;
1 million mammograms

10.2
million members

38
hospitals

650+ outpatient surgery
centers, medical office buildings,
and other outpatient facilities

KAISER PERMANENTE®

70 years of
providing care

\$60B
in revenue

\$62B
in assets

225,000
inpatient
surgeries

98,000
births

40.2M
doctor
office visits

188M
visits to KP.org
My Health Manager

22M
secure messages
sent to providers

150M
lab orders
per year

78M
prescription
orders per year

4.8M
appointments
booked online

23.2 million real time exchanges of standardized record sets between health care entities for treatment purposes

One-stop shopping for most services

- Ambulatory/outpatient care
- Audiology and optometry/ophthalmology
- Behavioral/mental health
- Diagnostic imaging, laboratory, and pharmacy
- Emergency care and hospitalization*
- Health education and preventive care
- Home health care
- Labor and delivery (childbirth)
- Occupational health (workers' compensation)
- Physical therapy
- Primary care working closely with specialty care, surgeons, hospitalists*

** Note: In Colorado, Georgia, and the Mid-Atlantic States, we contract with community hospitals for beds and some specialty care.*

Innovative ideas from the beginning

- Prepayment
- Group practice
- Prevention/total health
- Population-based approach
- Clinical information technology

Photo:

Sidney Garfield, MD (left): a surgeon, visionary, and trailblazer

Henry J. Kaiser (right): an entrepreneur who revolutionized shipbuilding and started global enterprises, including cement, steel, aluminum, and automobiles

KP has the most # 1 ranked effectiveness-of-care measures in the U.S., including:

- Breast cancer screening
- Cervical cancer screening
- Controlling high blood pressure
- Persistence of beta blocker treatment after heart attack
- Comprehensive diabetes care
- Counseling for nutrition in children
- Counseling for physical activity in children

About Clinical Terminology, Its Challenges, and Some Ways It Is Used

Scenarios for the use of terminology

- Use case for *classification* based on ICD:
 - *I have a record.* Everything in the record needs to be assigned *the right code* in a classification system.
 - Not everything is in the classification system, therefore “Not Otherwise Specified” (NOS) and “Not Elsewhere Classified” (NEC) codes are necessary and meaningful.
 - Supports consistent administrative reporting and financial transactions.
- Use case for *clinical terminology* based on SNOMED CT:
 - *I have a patient.* I can document everything that is relevant, and my EHR system will attach codes to much of it *(but not all)*.
 - NOS and NEC are meaningless.
 - Supports semantic interoperability, decision support, care of individual patients, and population health management.

Key U.S. legal/regulatory requirements

- Law and regulation require the use of over 50 different standard terminologies and classification systems in health care enterprises
- Meaningful Use regulations require certified EHR technology to use SNOMED CT for clinical documentation of problems, and LOINC for laboratory procedures, for care coordination, referrals, transitions of care, and patient access to health summaries.
 - Use of SNOMED CT and LOINC for interoperability is required for certification of EHRs and hospital or physician compliance may be audited under Meaningful Use.
- HIPAA law requires the use of classification systems to document health care interventions for administrative purposes such as insurance billing, mortality records, or reporting.
 - Current Procedure Terminology (CPT) is used to classify outpatient procedures and inpatient services. CPT-4 is owned by the American Medical Association
 - International Classification of Diseases (specific schemes published by the US government) is used to classify inpatient and outpatient diagnoses and inpatient procedures: ICD-10-CM (Clinical Modification) for diagnoses; ICD-10-PCS (Procedure Coding System)

Terminology implementation

- Implementing an enterprise terminology management solution is an important part of the implementation of health information technology with electronic health records. It is not an independent activity.
- Kaiser Permanente uses Convergent Medical Terminology (CMT) in KP HealthConnect®
 - Based on SNOMED CT and Laboratory LOINC.
 - CMT includes concepts not yet in SNOMED CT therefore not in cross-maps to ICD.

What is Convergent Medical Terminology (CMT)?

CMT is Kaiser Permanente's enterprise terminology system – how data is captured in KP HealthConnect® – which includes several components:

- End user terminology
- Standard terminology
- Administrative codes
- Patient/population query and decision support
- Terminology request process

CMT end user terminology component (1)

- CMT contains the terminology used by clinicians in KP HealthConnect® and by patients in kp.org and mobile apps
- End user terms are mapped to the standard terminologies and have data attributes needed by the application software
- End users use and see the terms that are familiar to them, and the application uses the codes and attributes it needs
- Patient-preferred display terms usually are the same as medical terminology but may be synonyms — such as “miscarriage” instead of “spontaneous abortion”

CMT end user terminology component (2)

- Protects clinician end users from changes in standard terminology or coding schemes
- Example: Almost all diagnosis terms displayed to clinicians did not have to be changed or deleted for the transition from ICD9 to ICD10
- Neither ICD nor SNOMED has an inherent focus on end user usability
- CMT is a product of over two decades of actual user experience, and it continues to improve every month

CMT standard terminology component

- CMT maps and integrates national and international terminology standards, such as SNOMED CT, ICD-10, and LOINC
- CMT can be mapped to other terminology as needed, such as local (non-standard) terminologies used in clinical technology, or terms developed and used for patient safety or quality measurement
- CMT supports requirements for standard terminology in Meaningful Use and Health Information Exchange programs

CMT administrative code component

- CMT supports Revenue Cycle, Charge Capture, and Risk Adjustment
- Administrative and financial coding is a by-product of the process for capturing patient care information — not a separate step
 - Diagnosis terms are mapped to ICD — clinicians pick a problem list and the same term is used for encounter diagnosis coding
 - Procedure terms are mapped to CPT4 or HCPCS codes
 - When a laboratory test order is resulted/completed, CPT4 administrative codes mapped to it are sent to the financial systems

CMT query and decision support component (1)

- CMT is built on SNOMED CT, the global language of health care.
- CMT leverages the internal structure of SNOMED CT, including poly-hierarchy and description logic (formal definitional attributes).
- CMT provides the ability to query different ways to identify subsets in terminology:
 - SNOMED CT logic improves precision and efficiency of queries
 - Supports decision support modules in KP HealthConnect®
 - Identifies patient cohorts for Population Care
 - Identifies KP HealthConnect® terminology to fulfill reporting or analytical criteria and specifications

CMT query and decision support component (2)

- Ability to easily identify patient cohorts for certain conditions for Population Care
- Ability to identify subsets for use as input criteria for KP HealthConnect® decision support modules, such as Best Practice Alerts, Reminders, etc.
- Ability easily to do precise queries, such as “find all conditions where causative organism is Aspergillus”
- Ability easily to do large aggregate queries, such as “find all patients with cardiovascular system disorders”

CMT request tracking component

- What happens when a desired clinical concept is not already present in KP HealthConnect®, such as a new medical diagnosis or a new regulatory requirement?
- Terminology request submission and release process:
 - Kaiser Permanente regions and business partners submit CMT requests for inclusion of concepts in KP HealthConnect®
 - Integration into published standards including SNOMED CT and LOINC, release schedule, quality assurance, and operational processes ensure availability of the requested terminology in HealthConnect®

Clinical terminology needs are dynamic

- According to the latest SIRS report from IHTSDO: since 2011 (last 5 years), Kaiser Permanente submitted 28,589 new concepts to NLM (US NRC) and IHTSDO
- New concept requests were in many recent KP submissions to IHTSDO and NLM:
 - Top 2500 Problem List;
 - Cardiology;
 - Mental Health;
 - Neurology;
 - Musculoskeletal;
 - Ophthalmology;
 - Hem/Onc;
 - Endocrine;
 - ENT/GI/ID;
 - Skin/Respiratory;
 - OB/Gyn;
 - Ortho Extremities;
 - Hx of and FHx of;
 - Ortho Non-Extremities;
 - Injuries;
 - Orthopedics;
 - Pediatrics;
 - Emergency Dept;
 - Common Lab Procedures;
 - Specimen Source;
 - Specimen Type;
 - Skin/Respiratory;
 - ENT/GI/ID;
 - Vaccinations;
 - Endo/Uro/Neph;
 - Radiology

Why “enterprise terminology”?

Internal:

- No one terminology meets all needs — standards meet specific needs
 - We must use many different terminologies, and we integrate or “converge” them in a central model in order to leverage the efficiencies of each terminology, and to provide interoperability
- None of the standard terminologies are ever “complete”; therefore, there is a need for new concepts or enterprise-specific concepts
 - Standard reference terminologies are updated slowly, e.g. 2x/year
- Having a central terminology management system eliminates duplication of effort and provides a common definition of data via common concepts/terms across the enterprise

External

- Standard terminology using SNOMED CT and LOINC the key to semantic interoperability in the U.S.
- Enables receivers of external data to understand the intended meaning precisely

Kaiser Permanente HealthConnect

Kaiser Permanente typically spends about 6% of our total revenue on information technology. KP HealthConnect (our integrated system for care delivery) is:

- More than just an electronic medical record
- A Program-wide system that integrates the clinical record with appointments, ancillary and specialty services, registration, and billing
- A complete health care business and management system that enhances the quality of patient care
- A personal health record for nearly 5 million Kaiser Permanente members (70% of members over 13 with Internet access)

Clinical Outcomes in Southern California

^{1/} Based on NCOA Quality Dividend Calculator

Kaiser Permanente member Mary Gonzales talks about her experience with KP, and how a receptionist using KP HealthConnect prompted and scheduled her for a mammogram.

Challenges Using, Analyzing, And Managing Health Care Data

General Challenges With Health Care Data

- Complexity
 - e.g., SNOMED CT concept model in combination with LOINC and medications models have $\sim 10^4$ or 10^5 times more concept members than IBM's Finance, Insurance, and Real Estate data model
- Heterogeneity
 - Different solutions over time, by geography, and different clinician documentation practices together result in variation in design, structure, or schema
- Fundamentals
 - Lack of consistent individual identities
 - General data governance practices, compounded by institutional fragmentation
 - Adequacy of original health care documentation varies wildly

Current Challenges With Health Care Analysis

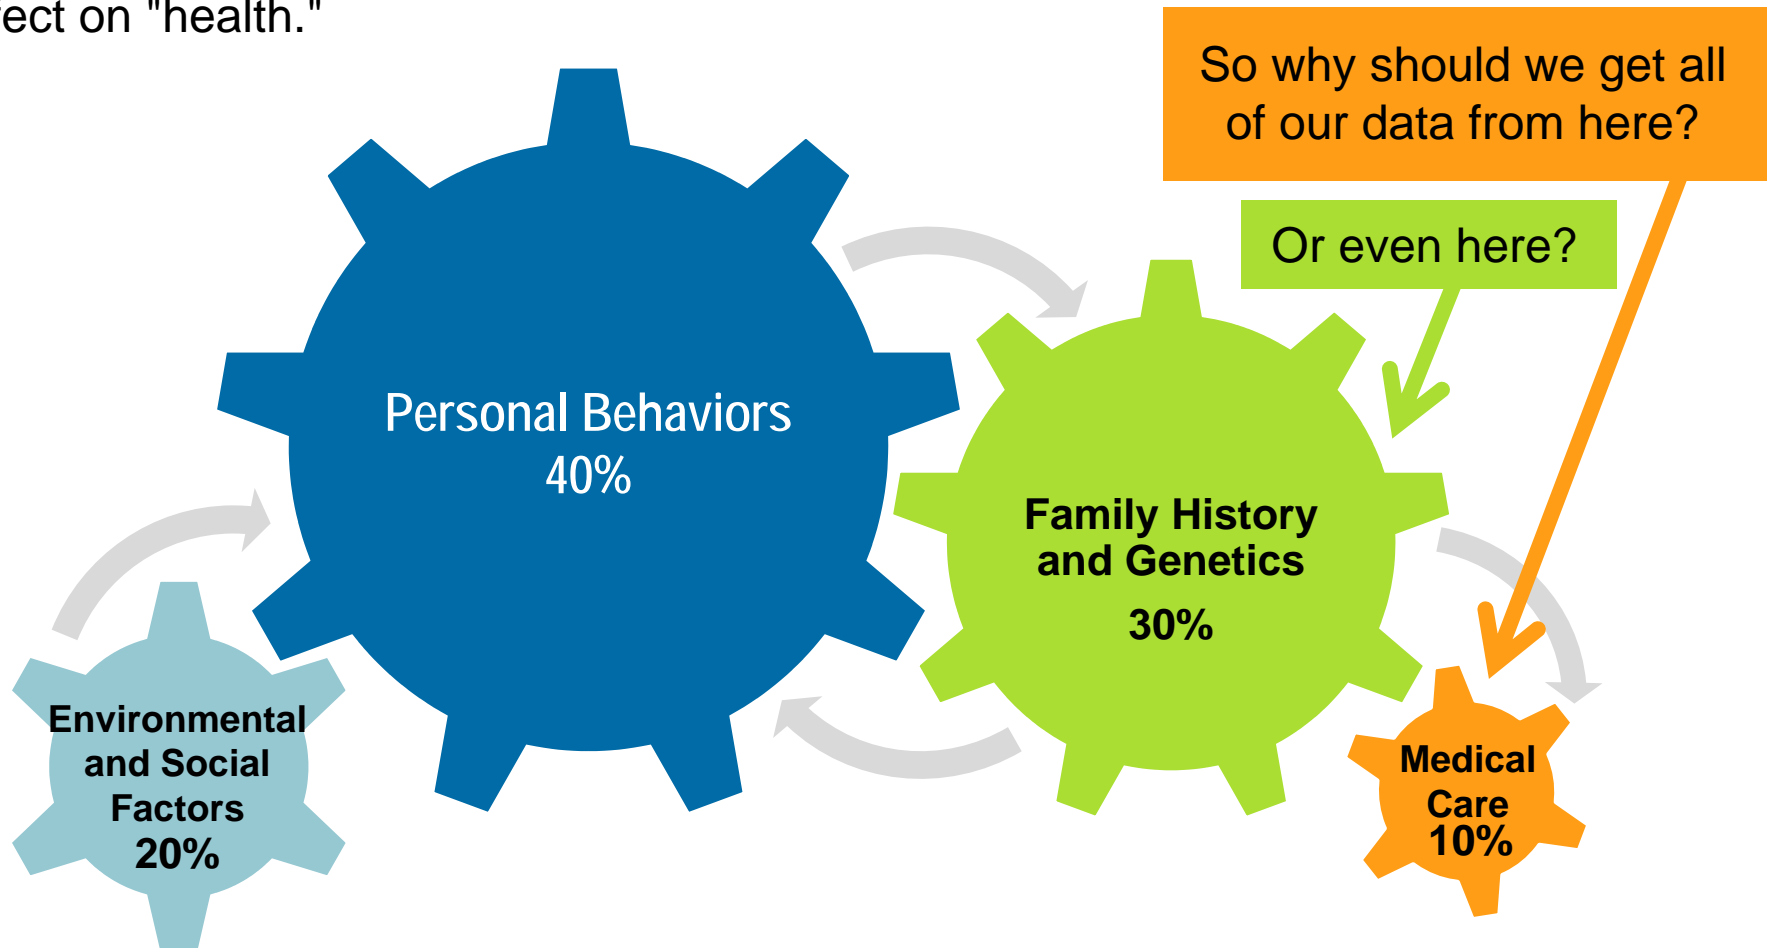

- Attribution
 - It is difficult to attribute care outcomes to a single practitioner and there is a need for validated attribution algorithms
 - Care is increasingly provided by “teams” where there is a need to produce quality process and outcome analyses by team, but technical measurement specifications do not address the performance of clinical teams
- Risk Adjustment
 - Individuals have different risk profiles and risk adjustment can assure a “fair” comparison, however, real differences in outcomes that might not be justified may be camouflaged. There is a need to strike a balance between measuring and reporting actual, crude outcomes (for quality improvement) and measuring and reporting risk-adjusted outcomes. Increased transparency in the simulation of coefficients for risk adjustment may be a benefit of using semantic technologies.
- Clinical Intelligence and Decision Support
 - Current systems have relatively poor precision resulting in workflow problems and alert fatigue. Much modeling will be needed to make systems “more intelligent.”

New Challenges With Health Care Analysis

- Guided Data Exploration and Predictive Modeling
 - Check whether data meets constraints, e.g. derive missing data
 - Trigger review of encounters
 - Define composition of disease or diagnosis by dynamic value sets to make suggestions
 - Trace documented diagnosis back through clinical guidelines (“best practices”) and evidence based protocols to highlight variance to clinicians
- Non-traditional Data Which May Be Relevant To Health
 - Financial records
 - Geolocation
 - Behavioral data
 - Social data

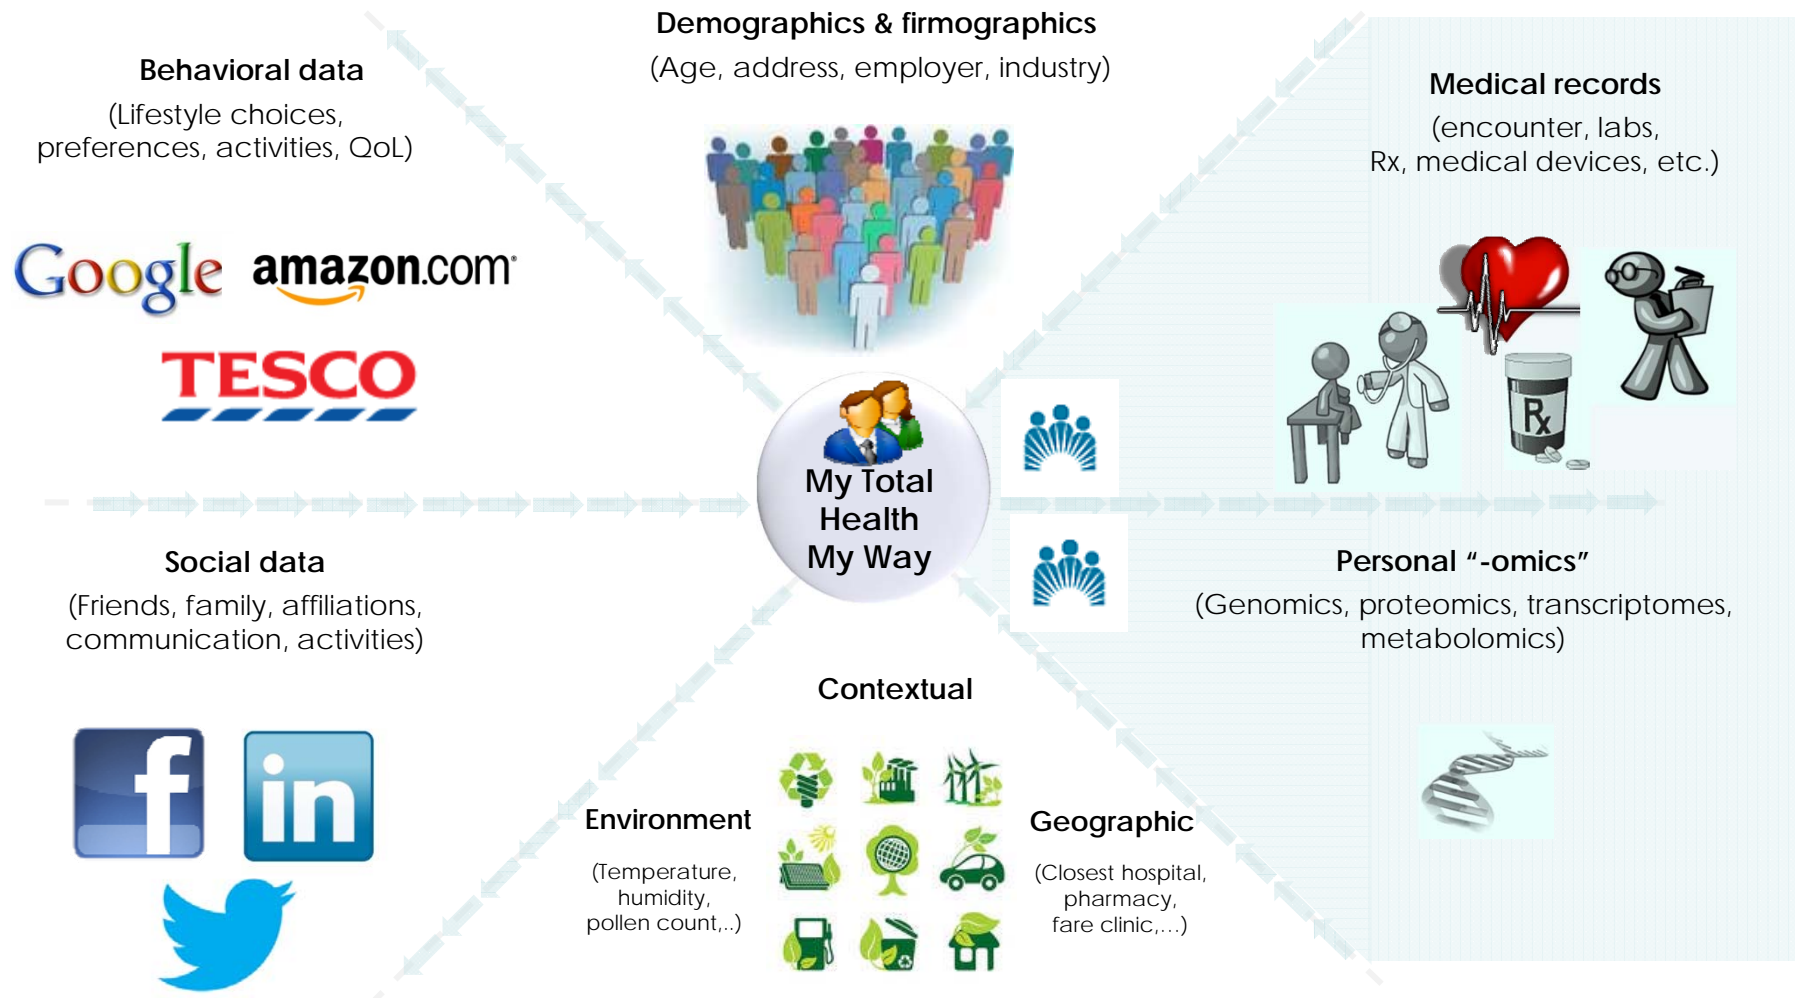

Health is About More Than Clinical Care

Healthcare encounters and interventions have a comparatively small effect on "health."

There is a real need for tools that capture and leverage these social determinants of health to supplement traditional healthcare process and outcome measures.

Personal information is increasingly complex
